        The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Streptococcus; GAS; GBS; group B streptococcus; Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; antiinflammatory; infection; vaccine; meningitis; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents the SMEZ-2 superantigen protein. The specification describes superantigen proteins SMEZ-2, SPE-G, SPE-H and SPE-J. The superantigen polynucleotides and polypeptides are used for subtyping Streptococci. They are also used for diagnosing Streptococcal disease. The superantigens are used in diagnosis of disease such as Kawasaki syndrome. They are also useful to recruit and activate T cells in a relatively non-specific fashion since they bind a large number of T cell receptor molecules by binding to the

(I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity

The present sequence corresponds to amino acids 151-167 of enterotoxin C1 (SEC1, see ABB76238) of Staphylococcus aureus. Sequence similarities are found in the corresponding regions of other staphylococcal enterotoxins and streptococcal yrrogenic exotoxins (see ABB76252-59). In the present invention, synthetic polypeptides useful in tumour therapy and in blocking or destroying autoreactive T and B lymphocyte populations are characterised by substantial structural homology to staphylococcal enterotoxin A and enterotoxin B, and to streptococcal pyrogenic exotoxins, with statistically significant sequence homology and similarity, Reagent for treating cancer without the need for e.g. radiotherapy, comprises a specific V beta subset of $\mathbb T$ cells sensitized to a growletumor and stimulated with superantigens -Disclosure; Page 4; 17pp; English. growing

                                                                                                                                                                                                                                                                                  of the peptides for diagnostic reagents, as vaccines and for theraples for pyrogenic exotoxin related diseases. Vectors expressing high levels of the peptides can be used in immunotherapy and immunoprophylaxis when expressed in humans. The antibodies are used for passive immunisation therapy to prevent or increase resistance to toxic shock syndrome or septic shock and to ameliorate the effects of conditions associated with the presence of staphylococcal or streptococcal pyrogenic toxins. The anino acid sequences of the peptides are sufficiently common that they can be used for eliciting antibodies which are cross-reactive with toxins derived from various bacteria. Sequences AxY97853-Y97861 represent conserved region 2 of various Staphylococcus aureus enterotoxins and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               simultaneously binding the lateral face of the T-cell receptor (TCR) while simultaneously binding the lateral face of the class II major histocompartibility complex (MHC) of antigen presenting cells. This causes aberrant proliferation of T-cells, which stimulates other components of the immune system, causing injury to the host. The peptides are used to prevent, treat or protect against toxic shock and septic shock resulting from bacterial infections in mammals, particularly humans. The peptides are used for inducing serum antibodies that bind at least one staphylococcal enterotoxin or streptococcal exotoxin and both the peptides and antibodies can be used in diagnostic assays to aid in the diagnosis of disease related to the presence of bacterial toxins. Nucleic acids encoding a peptide of the invention can be used for the production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             exotoxins) constitute a family of structurally related toxins which share similar biological activities. They stimulate CD4+, CD8+ and gamma-delta+ T-cells by binding the beta-chain variable region (V-beta) elements on the lateral face of the T-cell receptor (TCR) while

 The present invention provides a number of single exon nucleic ac probes which are derived from genomic sequences expressed in the brain. They can be used to measure gene expression in brain cell which may enable the diagnosis and improved treatment of nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The peptide, nucleic acid encoding the peptide and antibody (Ab) produced against the peptide are useful for inhibiting blastogenesis of mononuclear cells (eg. T cells) in the presence of human immunodeficiency virus (HIV), inhibiting HIV replication and protecting a mammal against the deleterious effects of HIV. The peptide is also used to ameliorate the effects of autoimmune diseases associated with the presence of HIV. The Ab is used for passively immunising a mammal against the deleterious
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immunodeficiency virus infections and associated deleterious effects, using peptides from homologous sequences of staphylococcal and streptococcal toxins \, -

                                                                          The present invention provides a number of single exon nucleic probes which are derived from genomic sequences expressed in the bone marrow. They can be used to measure expression in bon samples, which may enable the improved diagnosis and treatment such as lymphoma, leukaemia and myeloma. The present sequence i protein encoded by one of the probes of the invention.

                                                                                                                                                                                                                                                                                  The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 genetic disorder.

measure Spatially-addressable set of single gene expression in human lung exon nucleic acid probes, used samples ç

DK,

Chen W,

Rank DR;

ID No 31161; 634pp; English

CC nucleic acid expressed in the human lung; measuring gene expression in a consumple derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung (CMRNA, and (b) measuring the label detectably bound to each probe of comence of the array; identifying exons in a eukaryotic genome, comprising contacting the array; identifying exons in a eukaryotic genome, comprising contacting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably control of the exon probe is included in the above mentioned microarray; assigning exons, the probe is included in the above mentioned microarray; assigning exons, to a single exon probe, comprising (a) identifying exons from genomic sequence by the method contact and (b) measuring the expression of each of the exons in several continuous and/or cell types using hybridisation to a single exon continuous and/or cell types using hybridisation to a single exon continuous and for the exon, where a common pattern of continuous and for sequences, mentioned in the specification, or encoded by the expression analysis, and for identifying exons in a gene, particularly cusing human lung derived mRNA and for the study of lung disease (COPD), interstitial lung disease (ILD), familial idiopathic pulmonary disease. Hormansky-budlak syndrome, sarcoldosis, nulmonary contents, control contents, caucher's disease, nulmonary contents. Hormansky-budlak syndrome, sarcoldosis, nulmonary disease. The invention relates to a spatially-addressable set of single exc nucleic acid probes for measuring gene expression in a sample deri from human lung comprising single exon nucleic acid probes having 12614 nucleic acid sequences mentioned in the specification, or the complements or the 12387 open reading frames derived from the 1261 pulmonary dysplasia, primary ciliary dyskinesis, pulmonary and hyaline membrane disease. The present sequence is a pepencoded by a single exon probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electron format directly from WIPO at probes. Also included are a microarray comprising the novel set of probes; the novel set of probes which hybridise at high stringency Niemann-Pick disease, Hermansky-Pudlak syndrome, sarcoidosis, pul haemosiderosis, pulmonary histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic ftp.wipo.int/pub/published_pct_sequences in electronic hypertension pulmonary derived exon one ដ õ

                                                                                                                                                            a toxin that has improved scauzing, a toxin that has improved scauzing infectious diseases due to useful for preventing or treating infectious diseases due to microorganisms in animals such as cows, pigs, horses, sheep, hens,
                                                                                                                                                                                    The present sequence represents a modified Staphylococcal enterotoxin C1, designated SEC-SER. The modified toxin is characterised in that the 95th amino acid (cysteine) is substituted with serine. This results in a toxin that has improved stability. The modified enterotoxin is

SEC3 was isolated and purified from S.aureus. It can be used for treating cancer, activating cytokine mediators and procoagulant systems, augmenting natural killer cell cytotoxicity, etc. The enterotoxin can be administered intravenously, optionally with lbuprofen to attenuate toxic reaction to SEC3. Synthetic polypeptides having structural homology to Staphylococcal exotoxins are claimed, provided the homology includes statistically significant sequence homology, alignment of Cysteine residues and

               The present sequence is the protein sequence of enterotoxin C3 (SEC3) of Staphylococcus aureus. Similarity is shown, in several stretches of sequence, between staphylococcal enterotoxins, streptococcal, pyrogenic exotoxins and staphylococcal exfoliative toxins (see ABB76334-44). In the present invention, synthetic polypeptides useful in tumour therapy and in blocking or destroying autoreactive T and B lymphocyte populations are characterised by substantial structural homology to staphylococcal enterotoxin A and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antitumor immune reactivity in vitro or in vivo contains and expresses an exogenous nucleic acid molecule encoding a superantigen or its active fragment and an exogenous nucleic acid molecule encoding a costimulatory molecule that activates T cells in conjunction with an antigenic stimulus. The invention may be used
                                                                                                                                                                                                                                                                                              Reagent for treating cancer without the need for e.g. radiotherapy, comprises a specific V beta subset of T cells sensitized to a growing tumor and stimulated with superantigens \,
                                                                                                                                                                                                                                                                                                                                                                                                           WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       19-DEC-2000;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Staphylococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Staphylococcus aureus enterotoxin C3

                                                                                                                                                                                                                                                                                        SEC1 was isolated and purified from S.aureus. It can be used for treating cancer, activating cytokine mediators and procoagulant systems, augmenting natural killer cell cytotoxicity, etc. The enterotoxin can be administered intravenously, optionally with ibuprofen to attenuate toxic reaction to SEC1. Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                statistically significant sequence homology and similarity (2 value of Lipman and Pearson algorithm in Monte Carlo analysis exceeding 6) to include alignment of cysteine residues and similar hydropathy profiles. These superantigens are used to treat solid tumours, including their metastases, without radiation, surgery or standard chemotherapeutic agents. A claimed method of human cancer treatment involves contacting haematopoietic cells from a patient with one or more superantigens ex vivo to generate stimulated cells, selecting a specific V beta subset of cells, and reintroducing these cells into the patient to induce an in vivo therapeutic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treating cancer with enterotoxin from Staphylococcus aureus - administered by IV injection, having same tumoricidal activity as Staphylococcal protein A without potential toxic reactions
                                                                                                             Sequence

Title: US-09-150-947F-16
Perfect score: 33
Sequence: 1 XXKXXXXXQEXD 12

Scoring table: BLOSUM62
Gapop 10.0 , Gapext 0.5

Searched: 283224 seqs, 96134422 residues

Total number of hits satisfying chosen parameters: 283224
Minimum DB seq length: 0
Maximum DB seq length: 2000000000
```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed CDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and apprehenciated. 5' ESTs are derived from mRNAs with intact 5' ends and each thorefore by useful to the full to the sequences have been obtained.
 Claim 13;
 New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and fo

 This sequence represents a secreted human protein encoded by the nucleic acid molecule designated Gene 176 from the human cDNA clone HFTBR48 (deposited as clone ATCC 97904 and ATCC 209050).

The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAV59502) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 186 novel genes and their fragments (nucleic acid sequences: AAV59511-V59812; amino acid sequences AAV74731-W75026) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypucleotides. Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in

a yeast two hybrid screen. The BRO2 protein was found to contain a seven amino acid sequence cyclin binding domain similar to that of BRO1, BRO3 and BRO4 (See also ABB47005-6). The DNA encoding this sequence is homologous to a sequence present in a D-like cyclin inhibitor gene and when integrated at the corresponding locus, functionally inactivates plant D-like cyclin inhibitor protein expression. The BRO4 coding sequence may be used to produce a hyperplastic variant plant, increase the growth rate of a plant, or increase the proportion of dividing cells in a plant cell population, relative to a wild-type plant, by functionally inactivating the expression of a plant, by functionally gene in a plant. BRO4 is useful for increasing the proportion of dividing cells in a plant a plant cell population comportising protoplast, seeds, root cells, meristem cells or leaf cells.

 The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polynucleotides, antibodies against human ovarian antigens, and the use of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and
 Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological diseases -

 uro-genital mucous membranes, and shows a low virulence. Of the eight proteins encoded by the plasmid, seven are encoded by the sense strand and the eighth is encoded by the complementary strand. These proteins can be used as antigens for the preparation of poly- and mono-clonal antibodies to be used in diagnostics. The antigens can also be used in the formulation of vaccines against infections due to CT.

 alternating double-stranded DNA in which a coding strand has alternating codins for Asp and the Phe in sufficient number to produce a polypeptide which is stable in predetermined host microorganisms. The DNA strand is then inserted into a cloning vehicle so that the resulting chimera directs the synthesis of the Asp-Phe protein. This protein is then cleaved with CNBr or trypsin to release the peptide which, after benzylation, can be fragmented by digestion with chymotrypsin.

(Updated on 16-AUG-2002 to add missing OS field.)
 This invention relates to a trypsin modulating oostatic factor (TMOF) compound. The compound specifically does not include the TMOF analogue peptides represented by AAB37942 - AAB37949. Sequences AAB37940 are TMOF analogues which may be included in the composition. The TMOF compound has pesticidal activity and is an inhibitor of pest digestive enzyme synthesis. The TMOF compound is useful for controlling pests such as mosquito larvae, coleopterans, lepidopterans, dipterans or blood-sucking insects of order Diptera, suborder Nematocera, family

 Using the method somatocrinin can be obtd. on a large scale with good yield and good purity. The prod. is used in man for the treatment of dwarfism and retarded growth and for anabolic protein deficiencies. In animals it is useful for promoting wt. growth for increased prodn., lactation etc. This index is based on EP-122818,

 Peptide core is repeated 2-20 times to form a cell-adhesive protein of mol. wt. 1,500-5,000. The protein is an (ant)agonist of cell-adhesive proteins such as fibronectin. It has high antimetastatic activity against cancer and can be used in immunomodulation, wound healing, platelet aggregation inhibition and alleviation of neuro-disorders. See also AAR00722.
 Polypeptide with repeated as anti-metastatic agent i cell-adhesion proteins
 The peptide corresponds to a C- and N-terminal truncated version of the Harvey ras oncogene from residues 17-44, i.e. from residues 30-32. The peptide is capable of binding to GTPase activating protein (GAP) thus inhibiting Ras activation by GAP and inhibiting Ras-dependent cell transformation. Derivative to the Ras control of the Ras capable of the Ras
 terminal truncations, or modifications of specific amino acids, e.g. the most potent Ras inhibitor is Ras 17-32. Oncogenic forms of Ras occur in various human cancers, e.g. colorectal carcinoma, exocrine pancreatic carcinoma and myeloid leukaemias. Ras complexed with GTP can bind GAP and this is thought to be the important step in the transformation activity of Ras. The peptide is also capable of
 Synthetic peptide inhibitors of Ras-GAP interaction antitumour agents against e.g. colorectal carcinoma pancreatic carcinoma and myeloid leukaemia

 This sequence is encoded by a PCR fragment of NI4-3 and represents the C-terminal peptide fragment of the truncated GAG protein. The DNA encoding this fragment was ligated into ClaI/SalI digested pX and the corresponding plasmid was used to produce the antisense virus of the invention. Antisense or truncated RNAs expressed by these viruses bind to the mRNAs expressed by the naturally occuring viruses (NOVs) and prevent the mRNAs from being translated into proteins, thereby

 AAR64556-589 are peptide derivatives of a 37 mer RF-1 peptide derived from respiratory syncitial virus (RSV) (AAR64590) which have been truncated at the Carboxy terminus. The peptides are DP-178 like peptides. DP-178 corresponds to amino acids 638 to 673 of the HTV-1 isolate LAI transmembrane protein 9941. It forms a putative alpha helix at the C-terminal end of the 9941 ectodomain, and complexes with DP-107 (corresponds to amino acids 558-595) which contains a leucine zipper motif. The peptides complex via non-covalent protein protein interactions. The peptide derivatives were identified by a computer assisted peptide sequence search. The antiviral activity of this peptide is not stated in the
 Computer search generated synthetic peptides - are inhibitors {\tt HIV} transmission

J. Bacteriol. 172:6797-6802(1990).

T. Bacteriol. 172:6797-6802(1990).

FUNCTION: ACUL PROPERI SYNTHETASE ACTIVATES TETRADECANOIC ACID.

IT IS A COMPONENT OF THE FATTY ACID REDUCTASE COMPLEX RESPONSIBLE FOR CONVERTING TETRADECANOIC ACID TO THE ALDEHYDE WHICH SERVES AS SUBSTRATE IN THE LUCIFERASE-CATALYZED REACTION.

CATALYTIC ACTIVITY: ATP + an acid + protein - AMP + diphosphate + an acyl-protein thiolester.

-I- PATHWAY: Bioluminescent fatty acid reduction system; second step.
 LUXE_VIBFI STANDARD; PRT; 3 AA. P24272; P24272; Ol-MAR-1992 (Rel. 21, Created) Ol-MAR-1992 (Rel. 21, Last sequence update) Ol-OCT-1996 (Rel. 34, Last annotation update) Long-chain fatty_acid-luciferin-component ligase

 Scoring table:
 Title:
Perfect score:
 Minimum
 Total number of hits satisfying chosen parameters:
 OM protein -
 Maximum
 ĕ
 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
